Über die nicht-alkoholische Fettleber-Erkrankung wurde erstmals 1976 publiziert

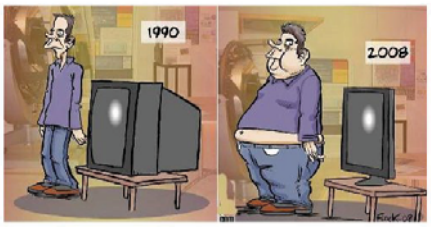
PUBMED-Suche „NAFLD“ am 04.09.2015

Zahl der Publikationen pro Jahr

Heute die häufigste Lebererkrankung in Industrienationen!

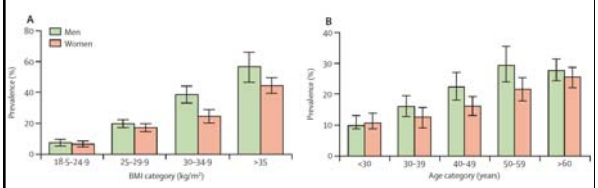
Was ist passiert?

Vom fetten Fernsehgerät – zur fetten Leber....



Prävalenz der nichtalkoholischen Fettleber in USA

NHANES III (1988–1994); n = 12.454;



Yki-Järvinen H. Lancet Diabetes Endocrinol 2014; aus Lazo M, et al. Am J Epidemiol 2013;178:38-45

NAFLD als kardiometabolisches Risiko: vor allem für Typ-2-Diabetes und KHK!

Diagnostik

Transaminasen sind ungeeignet zur NAFLD-Diagnose!

Prävalenz der NAFLD / NASH bei Typ-2-Diabetikern

- 103 Typ-2-Diabetiker mit normalen Transaminasen AST (= GOT), ALT (= GPT) aus San Antonio, Texas
- Außer MetS/T2DM keine manifesten Erkrankungen
- Diagnose mit MRT

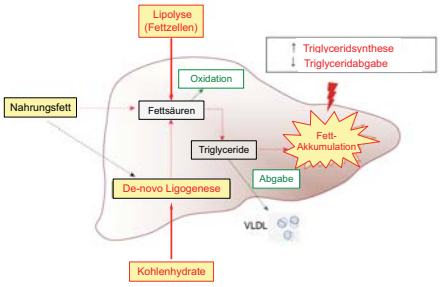
=> Prävalenz der NAFLD = 76 %

=> Prävalenz der NASH = 56 %

Portillo Sanchez P, et al. J Clin Endocrinol Metab. 2014 Oct 10; epub ahead of print

Pathophysiologie

Wie entsteht die nichtalkoholische Fettleber?



Ferramosca A, et al. World J Gastroenterol 2014;20:1746-1755

Woher stammt das Fett in der Leber?

Bei übergewichtigen Patienten mit nicht-alkoholischer Fettleber (mit Hypertriglyceridämie u. Hyperinsulinämie) stammt das Fett in der Leber zu

- 59 % aus der Lipolyse der Adipozyten
- 26 % aus der „de novo“ Lipogenese (Kohlenhydrate)
- 15 % aus dem Nahrungsfett

Lipodystrophie und ektope Fetteinlagerungen

Lipodystrophie und Folgen

- Schwund des Unterhautfettgewebes
- Starke Fettansammlung (Kinn, Innenseite Oberarm, Achselhöhle)
- Männliches Erscheinungsbild bei Frauen
- Auffallend kräftige Muskulatur
- Fettstoffwechselstörung
- Bauchspeicheldrüsenentzündungen
- Fettleber mit erhöhten Leberwerten
- Störung der Blutzuckerregulation
- Acanthosis nigricans (Achselhöhlen, des Halses u. der Leistenbeugen)
- Bluthochdruck (nicht bei allen Patienten)
- Erhöhtes Risiko von Arteriosklerose, Herz- u. Hirninfarkt u. Verschlüssen
- Hormonelle Störungen
- Nervenkompressionssyndrome

„Überlaufen“ von Fettzellen unabhängig von der Größe des Fettdepots

schlanker, gesunder Mensch ausgeglichene Energiebilanz

übergewichtiger, insulinresistenter Mensch

normalgewichtiger mit Fettspeicherstörungen in ausgeglichener Energiebilanz

Gesund trotz Übergewicht – die Geheimnisse der „glücklichen Dicken“

Inge Brinkmann | 11. September 2013 | 0 Kommentare

Prof. Norbert Stefan

- Der BMI trennt nicht zwischen gesund und krank

  „Der Body-Mass-Index (BMI) allein eignet sich nicht für eine scharfe Trennung zwischen ‚gesund‘ und ‚krank‘.“

- Des Rätsels Lösung liegt in der Leber

  „Nur wenn die Leberzellen verfettet sind, verschlechtert sich auch die Prognose des Übergewichtigen. So wirkte sich der Fettgehalt der Leber in Studien wesentlich deutlicher auf die Insulinsensitivität bzw. die Inzidenz eines Typ-2-Diabetes aus als die Menge des Bauchfetts ganz allgemein. Außerdem ist zwischen den verfetteten Leberzellen und dem Auftreten von Gefäßschäden nachgewiesen – und zwar unabhängig von weiteren atherosklerotischen Risikofaktoren.“

Ektope Fetteinlagerungen und Folgen

- erhöhtes Insulin
- erhöhter Nüchtern-Blutzucker
- erhöhter Blutdruck
- erhöhtes VLDL und Triglyceride
- erniedrigtes HDL-Cholesterin
- mehr kleine dichte LDL-Partikel
- gestörte Blutgerinnung
- erhöhte Harnsäure
- Nierenfunktionsstörungen
- etc.

Dysfunktionales Fettgewebe, NAFLD u. Folgeerkrankungen

ABSTRACT

Non-alcoholic fatty liver disease (NAFLD) is the hepatic manifestation of the metabolic syndrome and the incidence of which is rising rapidly due to the increasing epidemic of obesity in both adults and children. The initial accumulation of fat followed by subsequent inflammation is central to the development of liver damage, and is critically influenced by host factors including age, gender, presence of diabetes, genetic polymorphisms and more recently by the gut microbiome. An increasing body of data suggest that NAFLD is also an independent risk factor of cardiovascular disease, which remains the commonest cause of mortality in such patients. This review focusses on the pathogenesis of NAFLD, and the evolution of new approaches to the management and treatment of NAFLD.

Review

NAFLD: A multisystem disease

JOURNAL OF HEPATOLOGY

Christopher D. Byrne[1,2,*], Giovanni Targher[3]

[1]Nutrition and Metabolism, Faculty of Medicine, University of Southampton, Southampton, UK; [2]Southampton National Institute for Health Research, Biomedical Research Centre, University Hospital Southampton, UK; [3]Division of Endocrinology, Diabetes and Metabolism, Department of Medicine, University and Azienda Ospedaliera Universitaria Integrata of Verona, Verona, Italy

Summary

Non-alcoholic fatty liver disease (NAFLD) is the most common cause of chronic liver disease in Western countries that is predicted to become also the most frequent indication for liver transplantation by 2030. Over the last decade, it has been shown that the clinical burden of NAFLD is not only confined to liver-related morbidity and mortality, but there is now growing evidence that NAFLD is a multisystem disease, affecting extra-hepatic organs and regulatory pathways. For example, NAFLD increases risk of type 2 diabetes mellitus (T2DM), cardiovascular (CVD) and cardiac diseases, and chronic kidney disease (CKD). Although the primary liver pathology in NAFLD affects hepatic structure and function to cause morbidity and mortality from cirrhosis, liver failure and hepatocellular carcinoma, the majority of deaths among NAFLD patients are attributable to CVD.

J Hepatol 2015;62:S47–S64

Inzidenz von Typ-2-Diabetes in Abhängigkeit von Übergewicht und NAFLD in China

4.736 gesunde Teilnehmer, 4 Jahre Follow-up = 17.223 Personen-Jahre, 380 Fälle von T2DM (Inzidenzrate = 8,0 %); mittl. Alter = 57 Jahre;

BMI	NAFLD	*n*	T2DM	Incidence rate[1] (%)	RR[2] (95%CI)
< 24	Control	2383	85	3.6	1.0
	NAFLD	616	81	13.1	3.407 (2.461-4.717)
About 24	Control	712	35	4.9	1.0
	NAFLD	537	102	19.0	3.455 (2.269-5.262)
About 28	Control	229	15	6.6	1.0
	NAFLD	259	62	23.9	3.438 (1.841-6.420)

BMI-Cut-Off für Übergewicht bei Asiaten ist ≥ 24!

Sugar sweetened beverages and fatty liver disease: Rising concern and call to action

Manal F. Abdelmalek[1,*], Chris Day[2]

[1]Duke University School of Medicine, Durham, NC, United States; [2]Newcastle University Medical School, Framlington Place, Newcastle upon Tyne, United Kingdom

The potential danger of SSB, and in particular fructose, and its link with various metabolic disorders including NAFLD has been widely documented and counseling patients, particularly those with pre-existing metabolic syndrome and NAFLD, is prudent from a public health standpoint. Pending further investigation to support or refute the rising concerns, a call to action for health care providers to counsel patients at risk of or with diagnosed NAFLD on avoidance of SSB as a modifiable risk factor for NAFLD acquisition and progression, is warranted.

The effect of rate of weight loss on long-term weight management: a randomised controlled trial

Katrina Purcell, Priya Sumithran, Luke A Prendergast, Celestine J Bouniu, Elizabeth Delbridge, Joseph Proietto

204 Teilnehmer (51 Männer, 153 Frauen); Alter: 18–70 Jahre, BMI 30 – 45;

- Phase 1: 12-wöchige schnelle Gewichtsreduktion vs 36-wöchige langsame Gewichtsreduktion zur Erreichung von 15 % Gewichtsverlust
- Schnell: 450 – 800 kcal/Tag mit drei Formula-Mahlzeiten pro Tag;
- Langsam: 400–500 kcal Defizit pro Tag mit „gesunder Mischkost" (15% E, 25–30% F, 55–60% KH) + Ersatz einer Mahlzeit/Tag mit identischer Formula
- Phase 2: 144-wöchige „Erhaltungsphase"; Ziel: 400–500 kcal Reduktion für alle mit „gesunder" Ernährung (15% E, 25–30% F, 55–60% KH)

Kohlenhydratreduktion

Increased De Novo Lipogenesis Is a Distinct Characteristic of Individuals With Nonalcoholic Fatty Liver Disease

Jennifer E. Lambert,[1] Maria A. Ramos–Roman,[2] Jeffrey D. Browning,[3] and Elizabeth J. Parks

[1]Center for Human Nutrition, Divisions of [2]Endocrinology and [3]Digestive and Liver Diseases, University of Texas Southwestern Medical Center, Dallas, Texas

As the understanding of NAFLD has evolved, scientists have questioned whether it is excess lipolysis or lipogenesis that causes fatty liver disease.[55] The present data join the large number of studies currently available showing that elevated lipogenesis, in combination with excess adipose FA release, is a significant contributor to this condition. Excess lipolysis is found in other conditions such as hypertriglyceridemia and obesity, but the distinctive elevation of lipogenesis in NAFLD suggests a causative role. As a result, these data provide strong support for the recent emergence of carbohydrate restriction as a goal of dietary therapy.[56,57] Whether lipogenesis as a target for pharmaceutical development will benefit fatty liver has yet to be determined.

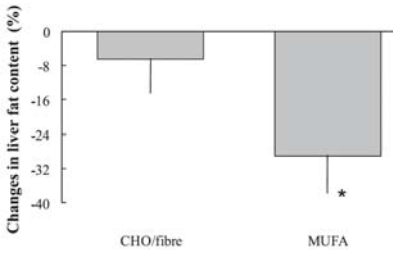
Einfach ungesättigte Fette in der Therapie von NAFLD

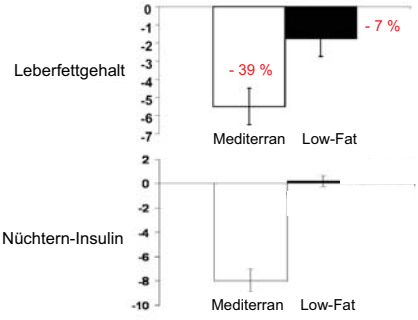
n = 45; randomisiertes Cross-over à 8 Wochen;
eukalorisch: KH-betont+Ballaststoff-reich vs MUFA-reiche Diät



Bozzetto L, et al. Diabetes Care 2012;35:1429–1435

Eukalorische mediterrane Kost vs Low-Fat/High-Carb

n = 12; Cross-over 6 Wochen eukalorisch, ohne Gewichtsreduktion



Ryan MC, et al. J Hepatol 2013;59:138-43

Ernährungstherapie der NAFLD

Die 5 Grundprinzipien:
- kalorienreduziert
- kohlenhydratreduziert
- eiweißbetont
- fettmodifiziert
- ballaststoffreich

Nährstoffspezifische Aspekte:
- Omega-3-Fettsäuren
- Vitamin E
- Cholin
- β-Glukan
- Inulin
- Carnitin
- Taurin
- Resveratrol
- Quercitin
- Koffein
- Kaffeesäure
- Kurkuma

„Leberfasten“ in der Therapie von NAFLD metabolischem Syndrom und Typ-2-Diabetes

Mahlzeiten-Ersatz-Konzept mit leberspezifischer Formula + kohlenhydrat-reduzierter, mediterraner Diät

Leberfasten® + LOGI in der Ernährungstherapie

bei NAFLD, metabolischem Syndrom, PCO-Syndrom, Gestationsdiabetes, Typ-2-Diabetes etc.

+

Leberfasten®

- 2 Wochen VLCD mit 3 x täglich Meal Replacement (Hepafast® => kohlenhydratarm, proteinreich, ballaststoffreich mit Milch (1,5 % Fett) zubereitet
- 780 kcal pro Tag
- ergänzt mit Rohkost, Salat, stärkearmem Gemüse und 1 TL MUFA-reichem Pflanzenöl, ca. 100-150 kcal

8 Uhr:
HEPAFAST®

13 Uhr:
HEPAFAST® + Gedünstetes Gemüse, Suppe, Salat oder Rohkost mit Dipp

18 Uhr:
HEPAFAST® + Gedünstetes Gemüse, Suppe, Salat oder Rohkost mit Dipp

Leberfasten®

Langfristiges Schema

Intensivphase: 2 Wochen – 3 x HEPAFAST + Rohkost + Öl ≈ 800-950 kcal/Tag

Reduktionsphase: 8-10 Wochen – 2 x Hepafast + 1 x LOGI-Mahlzeit ≈ 1.000-1.100 kcal/Tag

Stabilisierungsphase: 4 Wochen – 1 x Hepafast + 2 x LOGI-Mahlzeit ≈ 1.300-1.600 kcal

Erhaltungsphase: Dauerhaft – Ernährung nach LOGI ≈ 1.500-2.500 kcal/Tag

Regelmäßige Auffrischung: 1 x im Monat: 3 Tage à 3 x HEPAFAST/Tag

Kasuistik

Patientin 45 Jahre, BMI 27, Bauchumfang 97 cm, FLI = 66

07.11.2014

HbA1c = 11,7 %

Therapie: 4 Wochen intensiv Leberfasten ohne Medikamente

22.12.2014

HbA1c = 8,3 %

30.03.2015

HbA1c = 6,1 %
